SUMMARY

Full-stack engineer, 6 years experience (3 at Mysten Labs) building scalable, high-performance systems end-to-end. Skilled across smart contract development, SDK integration, and system architecture. Shipped production systems handling real-world scale, with a focus on security, performance, and maintainability.

EXPERIENCE

Software Engineer Sept. 2023 - Present

Mysten Labs • Remote

- Core contributor to Walrus Sites, a decentralized web hosting platform built on Sui and Walrus; drove the project from development to mainnet, now serving 250K unique visitors and 9.4M requests per month with zero downtime across 1.5+ years of continuous deployment.
- Reduced hosting costs for a core service of the platform by \$350K annually through targeted infrastructure and architectural optimizations.
- Led a sub-team of 4 engineers focused on system architecture, owning the review and design of both internal and partner solutions at scale.
- Built client-side Sui object management tooling to optimize object handling during transaction building and execution, increasing throughput of client requests.
- Developed and maintained a suite of tools and SDKs to improve the developer experience for Sui DeFi builders, including the Hashi TypeScript SDK (creator), the DeepBook sandbox environment (contributor), and other high-performance utilities focused on usability and developer ergonomics.

Software Engineer Mar. 2021 - Sept. 2022

Programize LLC • Athens

- Engineered scalable data ingestion pipelines for ActionIQ, a NYC-based enterprise client, enabling reliable processing of terabytes of data across large-scale customer deployments.
- Spearheaded a full rewrite of a React Native application into native iOS, delivering a robust codebase exceeding 15,000 lines of code from the ground up.
- Streamlined internal company workflows by applying operations research methodologies, reducing manual overhead and improving process efficiency.

ML & Data Engineer Nov. 2020 - Mar. 2021

METIS Cybertechnology • Athens

- Led a comprehensive refactoring of a conversational chatbot application, improving code maintainability and scalability through modular architecture redesign.
- Engineered and optimized NLP pipelines to enhance chatbot language understanding, enabling more accurate and context-aware conversational responses.
- Applied machine learning techniques to streaming maritime sensor data to predict CO2 emissions of ferries.

EDUCATION

Athens University of Economics and Business | 2018 - 2019

M.Sc. Computer Science

Grade: 8.21/10

Athens University of Economics and Business | 2014 - 2018

B.Sc. Statistics

Grade: 7.22/10

SKILLS

TypeScript Rust Python
Solidity Move Scala Node.js
Bun.js Tokio Spark Keras
scikit-learn Solana Ethereum
Sui Bitcoin DeFi
Distributed Systems PostgreSQL
Redis SQL NoSQL Docker
Kubernetes CI/CD Linux
OR-Tools Team Leadership

LANGUAGES

Greek (Native) • English (Fluent) • Italian (Fluent)

ML Engineer & Backend Developer

Jan. 2020 - Nov. 2020

VAIX • Athens

- Developed and deployed REST APIs, processing modules and ML models.
- Built KPI dashboards; optimized database query performance. Optimized critical SQL queries by up to 85%, reducing runtimes from hours to minutes for daily recurring workloads — significantly cutting cloud hosting costs at scale
- Reduced infrastructure overhead by streamlining database query efficiency, enabling high-frequency daily pipelines to run reliably without resource bottlenecks
